

MICROSOFT STUDENT ACCELERATOR
PROJECT 2: Azure & Cloud fundamentals
WEBSITE REPORT

Project 2 is by the most interesting one of the lot, I had the opportunity to learn a lot from the bootcamp and Microsoft learn and implement it in the assignment. I am happy to say that I can now design a webpage successfully. I have designed a webpage that showcases my resume that includes my education, past experiences, skills and qualifications. I have also put in an “ask me anything” section for viewers to shoot across any queries or questions they would like answered.

Plug in's implemented:

From the vast array of plugins available across WordPress and to be implemented towards the webpage for apt, secure and fast processing and page performance, I have narrowed it to the following.

Anti-spam: This plugin helps users to avoid being subjected to spam in any form. It protects the page and the user from outside spambots and equivalents.

Analytics: I chose to provide an analytics plugin to present statistics to understand the various data in respect to the audience that is being attracted towards the webpage and analysing the activity based on factors such as; country, general stats, referrers, returning visitors, etc., I decided to stick to Google Analytica rather than the rest simply because it being reliable and user friendly.

SEO: A SEO framework plugin has been included in the webpage that results in a faster, advanced, automated and accessible solution to my WordPress page.

Total Cache: To provide fast and secure experience for users, I opted to implement a highly rated and a complete WordPress plugin.

The above Plugins were the right fit for my webpage to enhance and improve the UX/UI of the viewers. I stuck to a minimal number of plugins since I found 5 to be off the right balance.
